

The questions:

What do I see in testing?

Can I explain what I see in testing? How does it happen - neurologically?

Why do I think it matters? Tell me about symptoms.

If I change what I see in testing, do symptoms change?

If I change what I see in testing, does it stay fixed?

If what I see in testing matters, can I predict someone will have a problem if they show what I see in testing?

How do we explain motion sensitivity in the presence of ICS?
